Subject: Software Construction

Introduction

This project is an Online Banking System that allows users to perform banking operations such as login, checking balance, transferring money, and viewing transaction history.

Objectives

- To develop a simple banking system
- To implement user authentication
- To manage transactions

Features

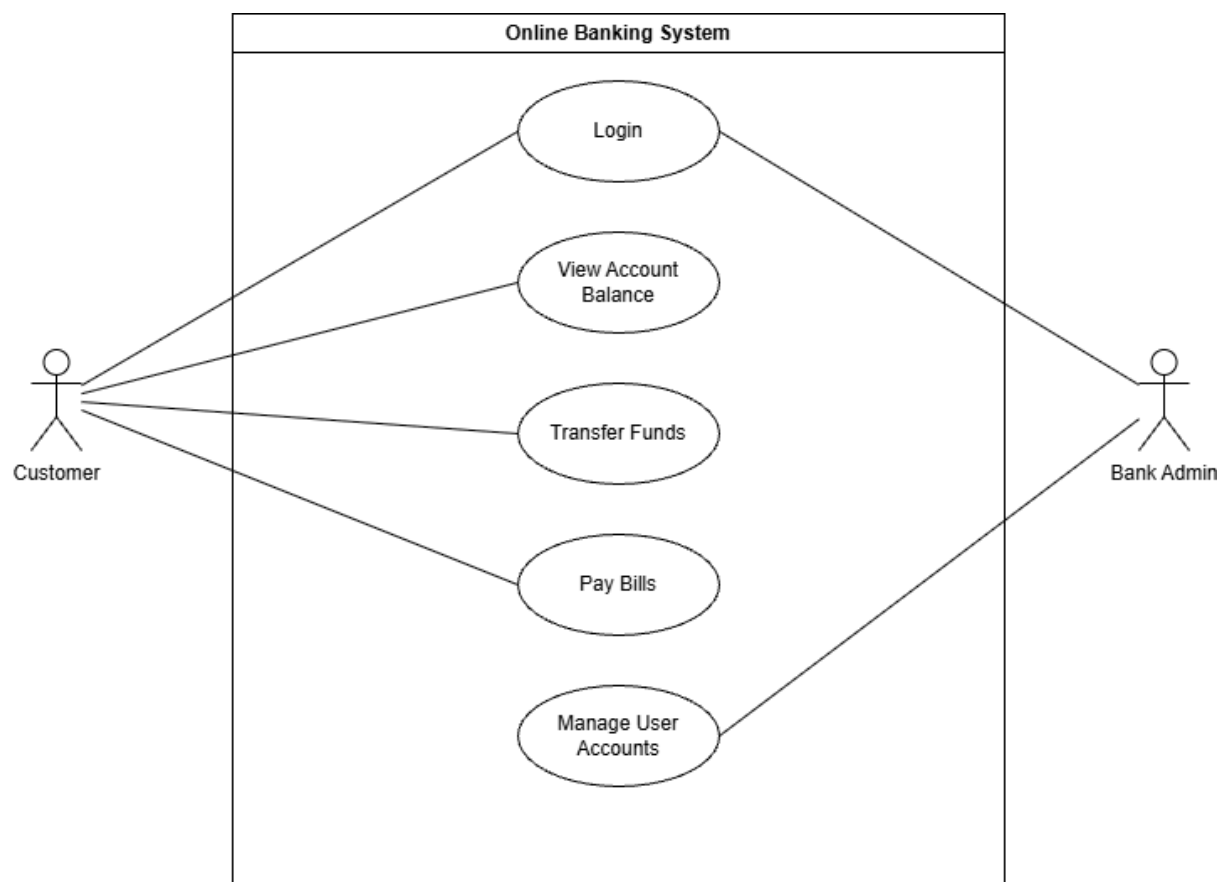

- Login system
- Balance inquiry
- Fund transfer
- Transaction history

Tools & Technologies

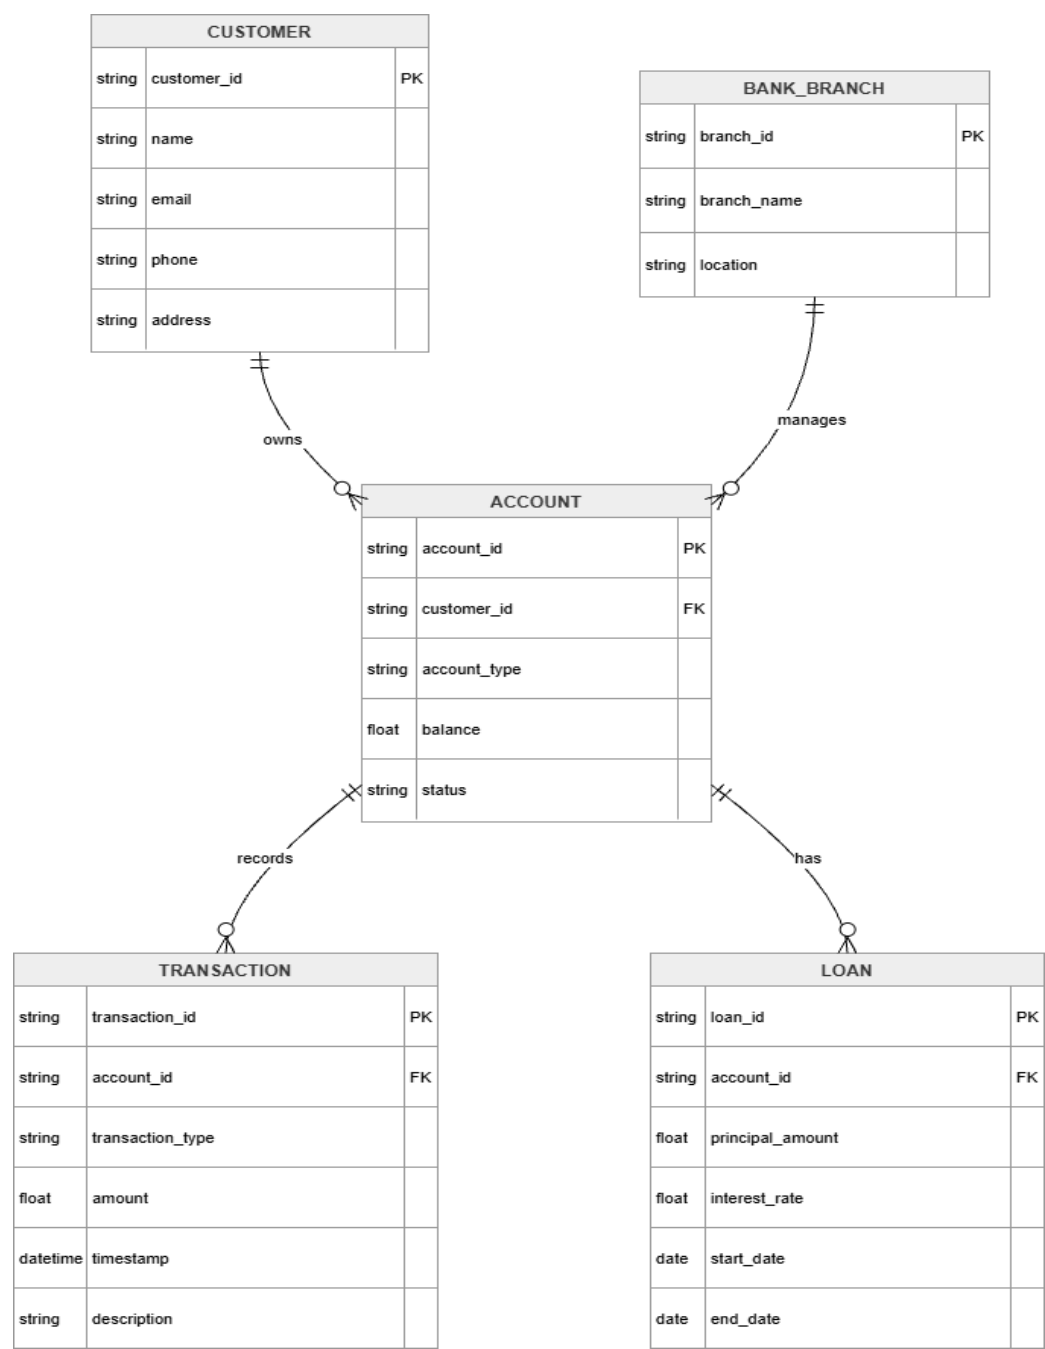

- HTML, CSS, JavaScript
- Azure DevOps
- GitHub

System Design

Implementation

The Online Banking System was developed using multiple web pages, each representing a specific functionality of the system.

◆ Pages Created

- **Login Page:**

Allows the user to enter username and password. After successful validation, the user is redirected to the dashboard.

- **Balance Page:**

Displays the user's account balance and provides options to navigate to other functionalities such as transfer and transaction history.

- **Transfer Page:**

Enables the user to enter receiver details and amount, and simulate a fund transfer operation.

- **Transaction Page:**

Shows a list of previous transactions such as money sent, received, and recharges.

Simple Working of the System

The system follows a basic flow:

1. The user logs in using valid credentials.
2. Upon successful login, the user is redirected to the balance/dashboard page.
3. From the dashboard, the user can:
 - View account balance
 - Transfer money
 - View transaction history
4. Each operation is handled through separate pages, and navigation is achieved using links and buttons.

The system demonstrates the basic working of an online banking application with simple front-end implementation.

Pipeline

A CI pipeline was implemented using Azure DevOps to automate the build process. The pipeline builds the project and publishes artifacts successfully.

Conclusion

The project successfully demonstrates an Online Banking System with basic functionalities using Azure DevOps and GitHub.
